- Track "At Risk" Activity

Education IT Asset Management and Student Safeguarding

EMS a powerful, full blown IT Asset Management product. Features include: automatic discovery of devices, hardware and software inventory, change tracking and software license management, energy monitoring, power management, USB endpoint security, printer monitoring, application and internet metering, a flexible alerting suite, and an easy-to-use software distribution module.

Often the dangers facing students follow an identifiable path. The sooner teachers and administrators can identify that path, the faster intervention can occur.

Dangers like pornography, radicalization, bullying, grooming, drug use, eating disorders, or racism, among others, are often propagated electronically through instant messaging, email and websites. EMS' eSafety module uses keyword and phrase monitoring to alert staff members of any online activity that may place a student at risk including internet monitoring of websites visited, as well as the option for students to report concerns directly to trusted staff. This gives school staff the tools to combat modern electronic dangers in a meaningful way.
